PROFESSIONAL SUMMARY

Frontend Engineer specializing in React/Next.js frontends for multi-tenant SaaS and sportsbook platforms, with 2.5 years building data-dense dashboards, RBAC, and Row-Level Security in PostgreSQL across products serving 6+ betting clients and 5+ businesses. Owned the data layer and performance fixes for a Next.js back office (data-fetching, TanStack Table, Zustand), led a Tailwind v2→v3 migration removing ~9,800 lines of legacy CSS, and implemented API caching and secure API-key flows that reduced redundant requests and improved session handling. Systems-oriented Mechanical Engineering background informs database design, Docker multi-stage builds, and reproducible SQL migrations.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, SQL, HTML5, CSS3

Frontend: React.js, Next.js, Vue.js (Vue 3), Nuxt, Tailwind CSS, shadcn/ui, Radix UI, TanStack Table, AG Grid

State & Data: Zustand, Axios, Supabase (PostgreSQL, RLS, Auth), REST APIs

Backend: Node.js, Express.js

Architecture: Multi-Tenant Systems, Role-Based Access Control, Row-Level Security

Tools: Git, GitHub, Docker (multi-stage builds), Postman, Vite, Vercel, Figma

PROFESSIONAL EXPERIENCE

Frontend Developer (Freelance/Contract) — *Sportsbook Back Office (SBE Ecosystem)* 2025 – Present

- Own the data layer of SBE's Next.js Back Office — architected the data-fetching layer with Axios, built the table system with shadcn/ui and TanStack Table, and optimized filtering logic and state management (Zustand) across high-density dashboards (player management, banking, bonus, risk, reporting) on an existing UI/auth scaffold.
- Built the Aviata Partner Back Office as a subset of the main Aviata BO; contributed to the main BO by optimizing API calls and adding an API key management feature.
- Built pages/features on the legacy Nuxt/Vue Back Office alongside the newer Next.js rebuild; added deposit/withdrawal features to the Aviatax mobile web app; optimized the Unified Cashier UI built with Vue.
- Resolved cross-origin (CORS) and API integration issues from Swagger documentation, worked on security considerations around impersonation tokens in admin tooling, and fixed a Docker Compose healthcheck port mismatch affecting service reliability in production.

Junior Developer / Growth & Content — *QuiqOrder (J6 Business, Startup)* 2024 – Present

- Contribute to frontend development of QuiqOrder's branded storefront platform for WhatsApp-based sellers, including UI development, Firebase integration, and the Shipbubble logistics integration for order fulfillment.
- Support lead generation and merchant activation through structured outreach and qualification campaigns.

MAJOR PROJECTS

Jirella Farm Management System — *Next.js, Supabase, PostgreSQL, AG Grid, Docker*

- Architected and solo-built a modular agricultural ERP spanning 8 core operational modules (Poultry, Aquaculture, Inventory, Sales).
- Translated complex real-world farm operations into structured software workflows for automated costing and harvesting tracking.
- Designed an advanced RBAC engine mapping 10 distinct staff roles to specific modules using custom PostgreSQL row-level security (RLS). Wrote idempotent SQL migrations (existence guards) for safe schema reruns, and containerized the application using multi-stage Docker builds.
- Standardized data handling by integrating AG Grid for high-density, server-side filterable dashboards.

SBE Affiliate & Attribution Portal — *Next.js 14, TypeScript, Tailwind CSS, Zustand, SWR, Radix UI, Zod, REST APIs.*

- Built the entire frontend of a multi-tenant affiliate and financial attribution platform for sportsbook/casino operators — traffic tracking, retention cohorts, commission settlement dashboards and consuming backend REST APIs.
- Implemented 3-tier RBAC and frontend session handling (silent JWT refresh, cross-device session termination, tenant context isolation) against existing backend auth endpoints.
- Built a custom design system using Radix UI primitives supporting dynamic light/dark theming.
- Built server-side paginated, filterable views over large activity logs and campaign directories using SWR caching and Zod schema validation.

EDUCATION

Federal University of Technology, Akure (FUTA)

B.Eng. Mechanical Engineering — 4.65/5.00, First Class, Graduated 2024
